**Workshop
Tips**

One simple simulation from A-Z step by step

How to define isotropic elastic material

How to use Truss element and related tips

Using SI units

How to apply concentrated Force

How to define static analysis and time concept in this step

Visualize the primary variables like stress, strain and etc.

Get report for stress, strain, reaction forces and deflections

How to scale results

How to see node and Element numbers

How to see undeformed and deformed results together

**Workshop
Tips**

Tips to start all simulations

Create points and models in 3D space

What is model tree and how to use it?

How to use Probe value option to watch some results?

How to simulate with plane stress element and usage conditions?

What are simplify conditions to model one part of model ?

How to apply uniform tension?

Using remeshing rule option to check convergency?

How to get result in specific path?

Theories

Introduction to ABAQUS Element Library

Characterizing elements

Introduction to different Types of Elements

Different Types of degree of freedoms

Element and node numbering

Element formulation

Integration Points

Beam Element and usage conditions

Types of Beams: Euler-Bernoulli

Types of Beams: Timoshenko

Beam element library of Abaqus

Preview

**Workshop
Tips**

Simulation with beam Element

How to specify beam orientation to watch some results

How create profile for beam section

How to see parts in different colors

How to plot moment and force with in beam model

Settings for plot(Font/Color/multiple plot/Legend ant etc.)

How to model beam with 3D element

How to define Dynamic Analysis

How to get html report from simulation steps

**Workshop
Tips**

Conditions to use Axisymmetric element

Conditions and usage of Analytical rigid part

How to define plasticity

How to use assembly models

common contact definition

How to use test results for stress-strain input and Engineering stress(strain) vs True stress(strain)

Shell simulation and conditions usage

Orthotropic Elastic material Definition

How to define Functional Loading

how to create local coordinate

Composite layup usage

How to see layers in details in composite materials

Theories

Where Explicit Analysis is used

Stability definition for Explicit Method

stability limit calculation

Example for stability limit calculation

Speeding up a Quasi static Explicit Analysis

Load Rate Scaling

Smooth Amplitude Curves

Mass Scaling

Mass VS. Load Rate Scaling

Energy Balance

CAEAssistant.com

Preview

Workshop Tips

Using load rate scaling to increase time of computation

Using Mass scaling to increase time of computation

Checking proper load rate scaling/mass scaling to get right result

Discrete rigid simulation and usage conditions

Plot combined curve (Load vs displacement for punch)

Plane strain simulation and condition usages

How to visualize axisymmetric element problem to 3D

How to visualize Plane strain element problem to 3D

How to use display group option to remove and hide

How to use DOF monitor

View results at the same intervals

View specific result in some node sets

How to plot ALLKE), external work (ALLWK), internal energy (ALLIE), and total energy (ETOTAL)
